LINFENG JIANG

College Park, MD | +1 240-355-7387 | ljiang19@umd.edu | dav1.is-a.dev

EDUCATION

University of Maryland, College Park | *College of Information* **Expected May 2027**

B.S. in Information Science + Advanced Cybersecurity | iSchool | ACES Honors College (Advanced Cybersecurity Experience for Students)

GPA: 3.96 / 4.00 | Semester Academic Honors, Fall 2024-Spring 2026

Coursework: Generative AI, Data Science Techniques, Statistics for Information Science, Data Sources & Manipulation, Data Visualization, Object-Oriented Programming

PUBLICATIONS, INTELLECTUAL PROPERTY & RESEARCH WRITING

- **"Let the Carrier Carry the Attack: Preserving the Subject in Adversarial Image Generation."** First author; ICLR 2027 submission (under review); arXiv:2609.39723.
- **"Rethinking Inter-LoRA Orthogonality in Adapter Merging: Insights from Orthogonal Monte Carlo Dropout."** AISTATS 2027 submission (under review).
- "A research on PDF protection mechanisms." *Applied and Computational Engineering*, 16, 159-165, 2023.
- "A Comparative Study of Machine Learning and Deep Learning Models for Weather Image Classification," ICCEIC, 2023. DOI: 10.1109/ICCEIC60201.2023.10426648.
- Heterogeneous Multi-Core Task Scheduling Method and System Based on an Improved Whale Optimization Algorithm, patent/application reference MC23-P10075.

RESEARCH EXPERIENCE

Research Assistant, University of Warwick | Concept-Based Adversarial Generation (Advisor: Andi Zhang) **Feb 2026-Present**

- Developed a segmentation-guided framework for personalized concept-based adversarial generation, preserving subject identity while enabling controllable manipulation of editable background regions.
- Introduced the concept of semantic carriers to characterize visible target-related evidence in adversarial generation, and designed controlled carrier conditions to study their effects on attack success, transferability, and subject preservation.
- Designed an inversion-based adversarial guidance method that injects targeted classifier gradients along diffusion reconstruction trajectories for controllable concept-level attacks.

Research Assistant, UT Knoxville | SNN Robustness & Reprogramming (Advisor: Suya FNU) **Feb 2026-Present**

- Investigating whether temporal dynamics and spike-based computation provide natural adversarial robustness across SNN training/conversion methods, datasets, model architectures, and attack families; MNIST is the current experimental testbed.
- Implemented matched ANN/SNN evaluation code and groupwise NRPM modules that reprogram synaptic contributions using representation and temporal discrepancy signals.
- Developing detect-then-reprogram and conditional-defense variants while studying robustness, attack success, detector behavior, latency, spike activity, and operation/energy cost.

NIST AI Risk Management Accessibility | *Research Project* **Jan-Mar 2026**

- Exploring concise inductive and deductive approaches for making NIST AI risk-management concepts easier to apply in practical model assessment.

TEACHING EXPERIENCE

Undergraduate Teaching Assistant, INST326: Object-Oriented Programming II | *University of Maryland* **Fall 2025-Present**

Undergraduate Teaching Assistant, INST126: Object-Oriented Programming I | *University of Maryland* **Fall 2025-Present**

Teaching focus: Python, object-oriented programming, data structures, software design, problem solving, and assignment support.

SELECTED TECHNICAL PROJECTS

Ultra-Short-Term Photovoltaic Output Forecasting (CNN-LSTM) **Aug-Nov 2025**

Context-Aware Steganographic Text Generation **Sep-Dec 2025**

Centralized Security Dashboard | *HACS408P Project* **Spring 2026**

ACADEMIC SERVICE & HONORS

ICLR 2027 Reviewer; Semester Academic Honors / Dean's List at UMD (2024-2026); top placements in JUST CTF, picoCTF, and Right CTF (2022); USACO Platinum (2022)

TECHNICAL SKILLS

Programming & data: Python, C++, Java, R, SQL, MATLAB, Linux/UNIX, data analysis and visualization, PyTorch, etc.
